

DIAGNOSING CULTURAL PROBLEMS OF OUTDOOR ORNAMENTALS

By: Gary H. Brinen, Extension Agent - Horticulture

SYMPTOMS	POSSIBLE CAUSES	PREVENTION OR CONTROL
<ul style="list-style-type: none"> • Overall poor growth • Poor flowering • General decline • Death of plant 	<ul style="list-style-type: none"> • Poor adaptation of plant (sun-shade/wet-dry). • Improper planting <ul style="list-style-type: none"> ○ planted too deep ○ planted in compacted soil ○ planted in container or with plastic sheeting covering rootball. 	<ul style="list-style-type: none"> • Set plants in the planting hole at the same depth they were grown in the nursery. • Remove container or plastic burlap before planting.
<ul style="list-style-type: none"> • Leaf margins burned • Tip burn • Marginal necrosis • Wilt when moist • Deficiency symptoms • Poor root system • Gradual decline 	<ul style="list-style-type: none"> • Salt injury--Salt spray areas; high natural soluble salts; liquid fertilizers applied to foliage; over fertilization with soluble sources; irrigation with salty water; drought; especially in containers 	<ul style="list-style-type: none"> • Do not over fertilize soil or foliage • Leach salts periodically. Use fresh water to irrigate • Do not allow soil to dry out excessively • Use salt tolerant plants
<ul style="list-style-type: none"> • Symptoms similar to salt injury • Small, uniform-sized spots which are yellow, brown or dead. • Sharp margin between spot and healthy 	<ul style="list-style-type: none"> • Chemical injury--Excessive application of a pesticide; wrong dilution of a chemical; application of a material 	<ul style="list-style-type: none"> • Calibrate equipment often • Check dilutions carefully • Check label registration, uses and restrictions

<p>tissue.</p> <ul style="list-style-type: none"> • Spray residue evident • Leaf drop 	<p>which is phytotoxic to a specific plant.</p>	<ul style="list-style-type: none"> • Check plant tolerance • Wash off chemical if possible
<ul style="list-style-type: none"> • Grayish-bluish cast to leaves • Curling of leaves • Wilting • Marginal leaf burn. • Leaf scorch and brown spots • Needle browning and drop 	<ul style="list-style-type: none"> • Drought injury--Lack of rainfall or irrigation; restricted root system--salts, soil problems, shallow rooted plant, new transplant; soluble salts; drying winds. 	<ul style="list-style-type: none"> • Irrigate • Increase water holding capacity of soil by adding organic matter • Remendy root problems • Do not over fertilize • Use wind breakers
<ul style="list-style-type: none"> • Wilt • Root rot • Deficiency symptoms • Yellowing of lower leaves • Stems soft and dark colored 	<ul style="list-style-type: none"> • Too much water -- Overwatering, especially on new plantings and house plants; poorly drained soil; high water table; excessive rainfall. 	<ul style="list-style-type: none"> • Do not overwater • Have drains in containers • Provide drainage in field • Plant in raised beds
<ul style="list-style-type: none"> • Plant dying suddenly 	<ul style="list-style-type: none"> • Overfertilization • Nylon rope girdling trunk • Poor drainage • Severe drought damage • Leakage from underground gas line • Misuse of pesticides 	<ul style="list-style-type: none"> • Water heavily to leach excess fertilizer out of the root zone. Keep plants well watered during the recovery period. Avoid heavy fertilizer applications. • Remove nylon rope holding the burlap around the trunk at planting. • Use plants that will grow in wet areas.

		<ul style="list-style-type: none"> • Water heavily every seven to ten days during dry period. • Dig a trench in the area of the gas leak to aerate soil.
<ul style="list-style-type: none"> • Damage to stems 	<ul style="list-style-type: none"> • Girdling of stem by nylon rope or wire • Cold damage • Lawn mower damage • Children, rodents and sap-suckers 	<ul style="list-style-type: none"> • Remove nylon rope or wire, at planting • Choose plants able to withstand low temperatures • Select a well-drained planting site • Place short posts around the base of plants • Mulch the area around the base of plants • Protect plants against damage by using wire barriers or other protective devices
<ul style="list-style-type: none"> • Browning of margins or tips of leaves 	<ul style="list-style-type: none"> • Cold damage • Poor soil drainage • Excessive fertilization • Mechanical damage to stem 	<ul style="list-style-type: none"> • Plants resistant to cold damage should be planted. Prune out dead tissue in spring and fertilize to promote vigor. • Divert drain spouts past plants. Plant species which will tolerate wet conditions. • Water heavily to leach excess fertilizer out of the

		<p>root zone. Keep plants well watered during the recovery period. Avoid heavy fertilizer applications.</p> <ul style="list-style-type: none"> • Place short posts around the base of plants.
<ul style="list-style-type: none"> • Plants failing to flower 	<ul style="list-style-type: none"> • Plant too young • Excessive vegetative growth • Nutritional deficiencies 	<ul style="list-style-type: none"> • Many plants simply will not bloom until they are several years old. Normal seedling variation results in individual plants that flower at different ages. • Reduce the fertilization frequency. • Apply fertilizer.
<ul style="list-style-type: none"> • Failure to produce berries 	<ul style="list-style-type: none"> • Cold or frost damage during flowering period • Plant is male • Improper pruning 	<ul style="list-style-type: none"> • Nothing can prevent this problem. • Male plants do not produce berries. • Improper pruning using shears removes most of the tip growth and flower buds. Without flower buds, a plant cannot produce berries.
<ul style="list-style-type: none"> • Yellowing of entire plant but lower 	<ul style="list-style-type: none"> • Nitrogen deficiency, including poor 	<ul style="list-style-type: none"> • Add complete fertilizer (fertilizer containing

leaves worst. Stunted, few breaks.	soil or no organic matter.	nitrogen, phosphorous and potassium). Add nitrogen fertilizer. Increase organic matter.
<ul style="list-style-type: none"> • Yellowing begins on margin and near center of old leaf. Progresses inward and downward; tip, upper margin and lower central veins may remain green. Necrosis and leaf drop. 	<ul style="list-style-type: none"> • Magnesium deficiency <ul style="list-style-type: none"> ○ Low in acid, marl or some alkaline soils. ○ Lack of lime in soil or potting mix. ○ Imbalance fertilization. 	<ul style="list-style-type: none"> • Liming with dolomite. Magnesium sulfate. Sulfate of potash-magnesia.
<ul style="list-style-type: none"> • Pronounced yellowing of younger leaves with veins appearing as fine green lines. Yellow to white if acute. Dwarf leaves, leaf fall, dead wood, dead tips. Reduced growth. 	<ul style="list-style-type: none"> • Iron deficiency <ul style="list-style-type: none"> ○ Low in acid, marl or alkaline soils. ○ Over-liming. ○ Excess water. ○ Poor root system. 	<ul style="list-style-type: none"> • Iron in complete fertilizer. Iron sulfate. Iron chelates. Lower soil pH. Increases organic matter.
<ul style="list-style-type: none"> • Mottled chlorosis begins between midrib and primary veins. Entire leaf may turn yellow but midrib and large veins stay green the longest. Red to purple seen as anthocyanins build-up. Frizzle top-yellowing, dwarfing and distortion. 	<ul style="list-style-type: none"> • Manganese deficiency <ul style="list-style-type: none"> ○ Low in acid, marl or alkaline soils. ○ Over-liming. 	<ul style="list-style-type: none"> • Manganese sulfate. Chelates. Lower soil pH.
